

Detecting and Analyzing Depression in Women Using Multimodal AI

Introduction:

Mental health is vital for overall well-being but is often overlooked, especially among women. Women are the backbone of families and communities, yet many face mental health challenges, with depression being particularly prevalent.

In India, around 31% of women suffer from depression. This highlights the urgent need for effective mental health interventions. Unfortunately, depression is often considered taboo, preventing many women from seeking help.

Our project leverages multimodal AI to detect and analyze depression in women. By combining various data sources and advanced AI techniques, we aim to provide a comprehensive understanding of depression and promote better mental health support for women.

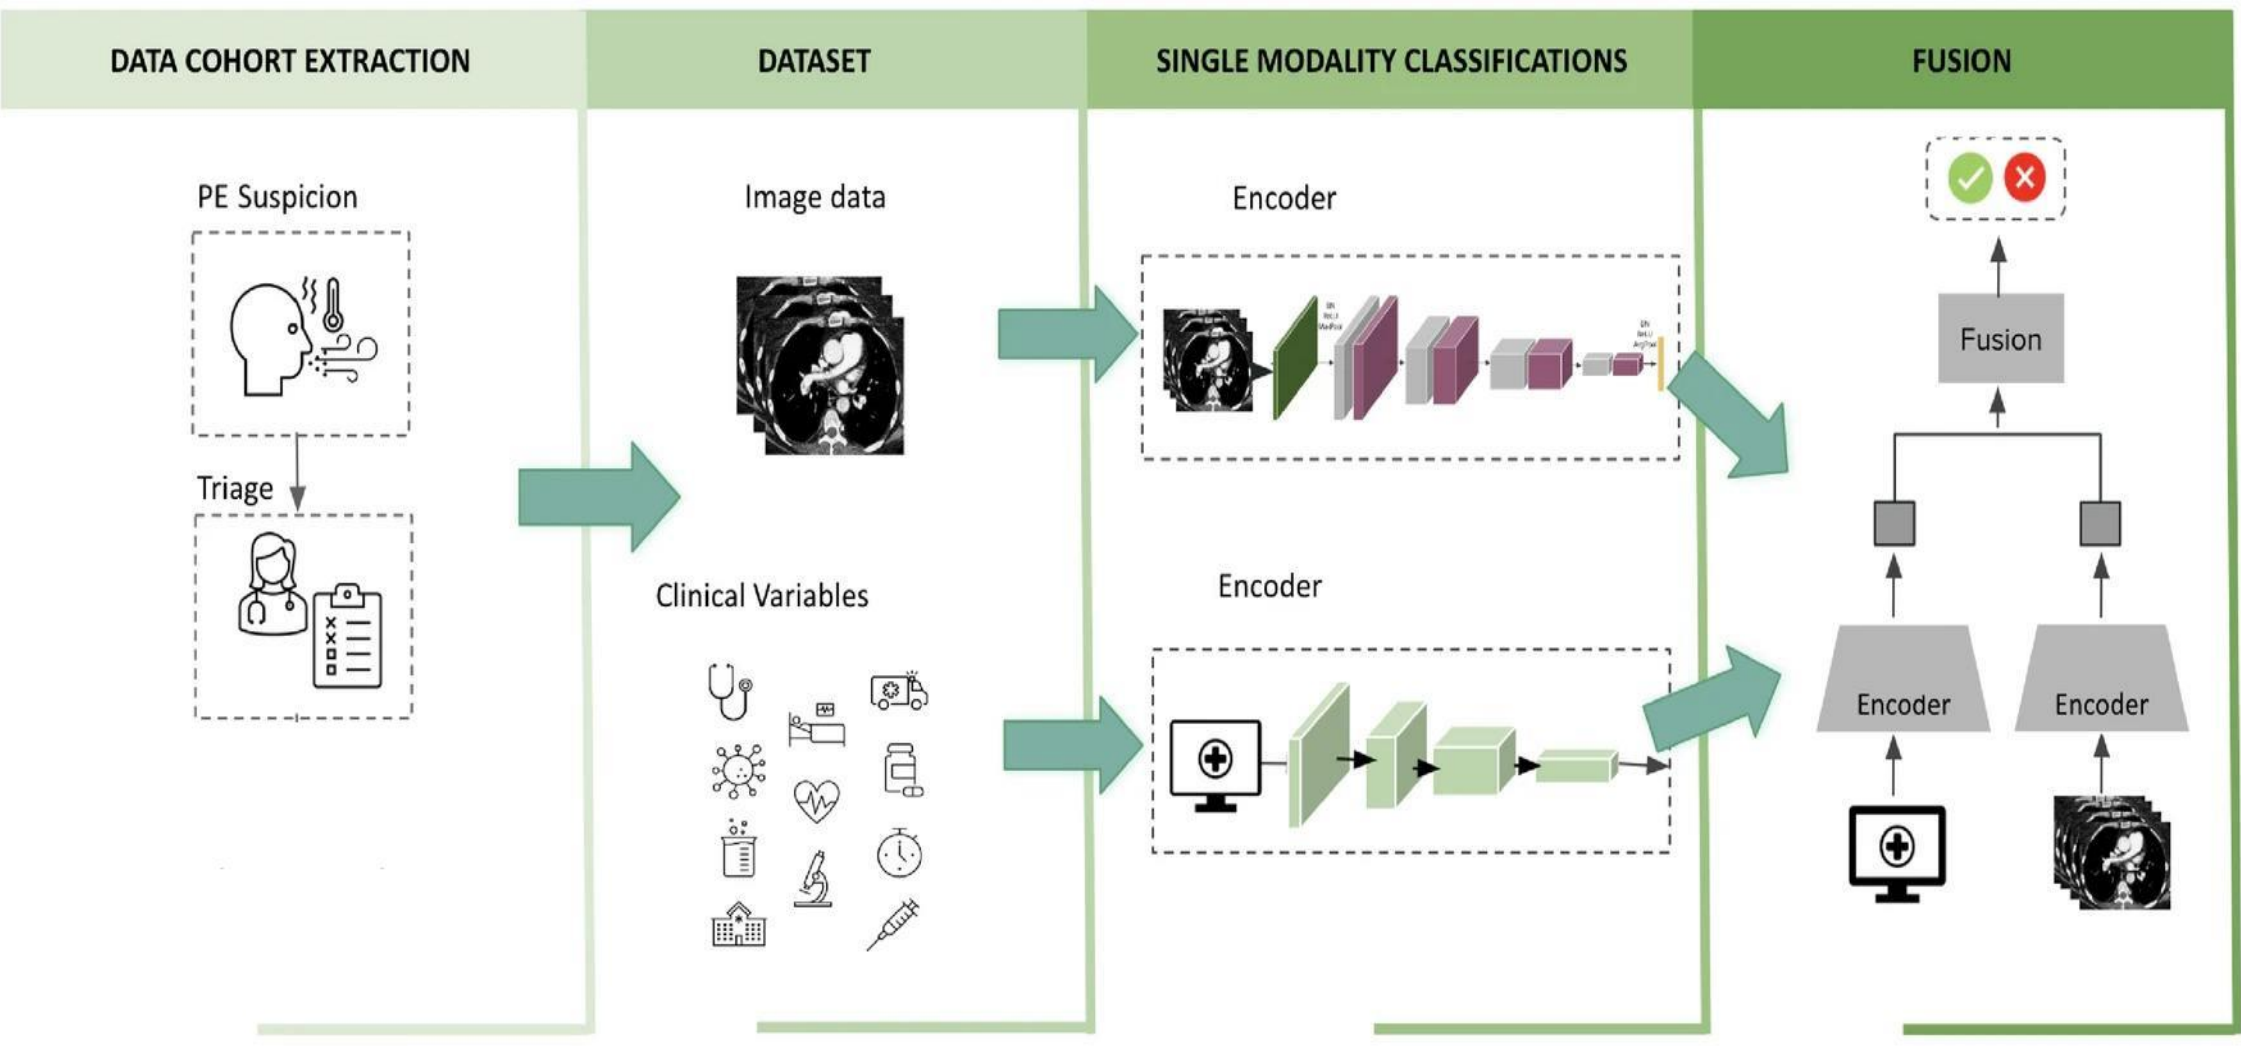

Objective:

Our research aims to create a powerful multimodal AI framework for identifying and understanding depression in women. By integrating data from various sources such as text, audio, and video, we strive to improve the precision and dependability of depression diagnosis.

Materials:

- Datasets**
- Text Data: Transcripts from interviews, social media posts, or written diaries.
 - Audio Data: Recorded speech samples, interviews, or voice notes.
 - Video Data: Recorded video interviews, facial expression datasets, or video diaries.
 - Physiological Data:
 - Breathing Monitoring: Data from respiratory sensors.
 - Heart Rate Variability: Data from heart rate monitors.
 - Sleep Tracking: Data from sleep tracking devices.
- Software and Tools**
- Programming Languages: Python, R, etc.
 - Libraries and Frameworks: TensorFlow, PyTorch, scikit-learn, OpenCV, etc.
 - Pre-trained Models: BERT for text analysis, VGGFace for facial recognition, etc.
- Hardware**
- Computing Resources: High-performance computing systems or cloud services like AWS, Google Cloud, or Azure for training models.
- Annotation Tools**
- Tools for labeling and annotating data, such as Labelbox or VGG Image Annotator.
- Evaluation Metrics**
- Metrics like accuracy, Confusion Matrix, precision, recall, RMSE (Root Mean Square Error) for assessing model performance.

Methods:

- Data Collection
 - Text Data: Transcripts from interviews, social media posts, written diaries.
 - Audio Data: Recorded speech samples, interviews, voice notes.
 - Video Data: Recorded video interviews, facial expression datasets, video diaries.
 - Physiological Data: Breathing monitoring, heart rate variability, sleep tracking.
- Data Preprocessing
 - Text: Tokenization, stop-word removal, stemming/lemmatization.
 - Audio: Feature extraction (e.g., MFCCs, pitch).
 - Video: Facial landmarks, expressions, movements.
 - Physiological: Normalization of sensor data.
- Feature Extraction
 - Text: BERT, TF-IDF, word embeddings.
 - Audio: OpenSMILE, librosa.
 - Video: VGGFace, optical flow.
 - Physiological: Heart rate variability metrics, sleep patterns, respiratory rates.
- Modeling
 - Text: BiLSTM, Transformer-based models.
 - Audio: SVM, CNN.
 - Video: XGBoost, CNN.
 - Physiological: Random Forest, RNN.
- Multimodal Fusion
 - Feature Fusion: Concatenation, attention mechanisms.
 - Model Fusion: Voting, stacking, blending.
- Evaluation
 - Metrics: Accuracy, precision, recall, Confusion Matrix.
 - Validation: Cross-validation techniques.
- Deployment
 - Integration: User-friendly application or platform.
 - Monitoring: Continuous monitoring and updates.

Results:

Montgomery-Åsberg Depression Rating Scale :

The questionnaire includes questions on ten symptoms:

- Apparent sadness
- Reported sadness
- Inner tension
- Reduced sleep
- Reduced appetite
- Concentration difficulties
- Lassitude
- Inability to feel
- Pessimistic thoughts
- Suicidal thoughts

Each item yields a score of 0 to 6; the overall score thus ranges from 0 to 60.Higher MADRS score indicates more severe depression.

Conclusion:

The integration of text, audio, video, and physiological data in a multimodal AI approach has proven to be highly effective in detecting and analyzing depression in women. This comprehensive method significantly improves accuracy and robustness compared to single-modality methods, offering a deeper understanding of depression and its symptoms for early intervention. While challenges like data quality, privacy concerns, and computational resources must be addressed, embracing advanced AI techniques is crucial for advancing in mental health care, emphasizing the importance of women's health in shaping society.
